1 Objetivo

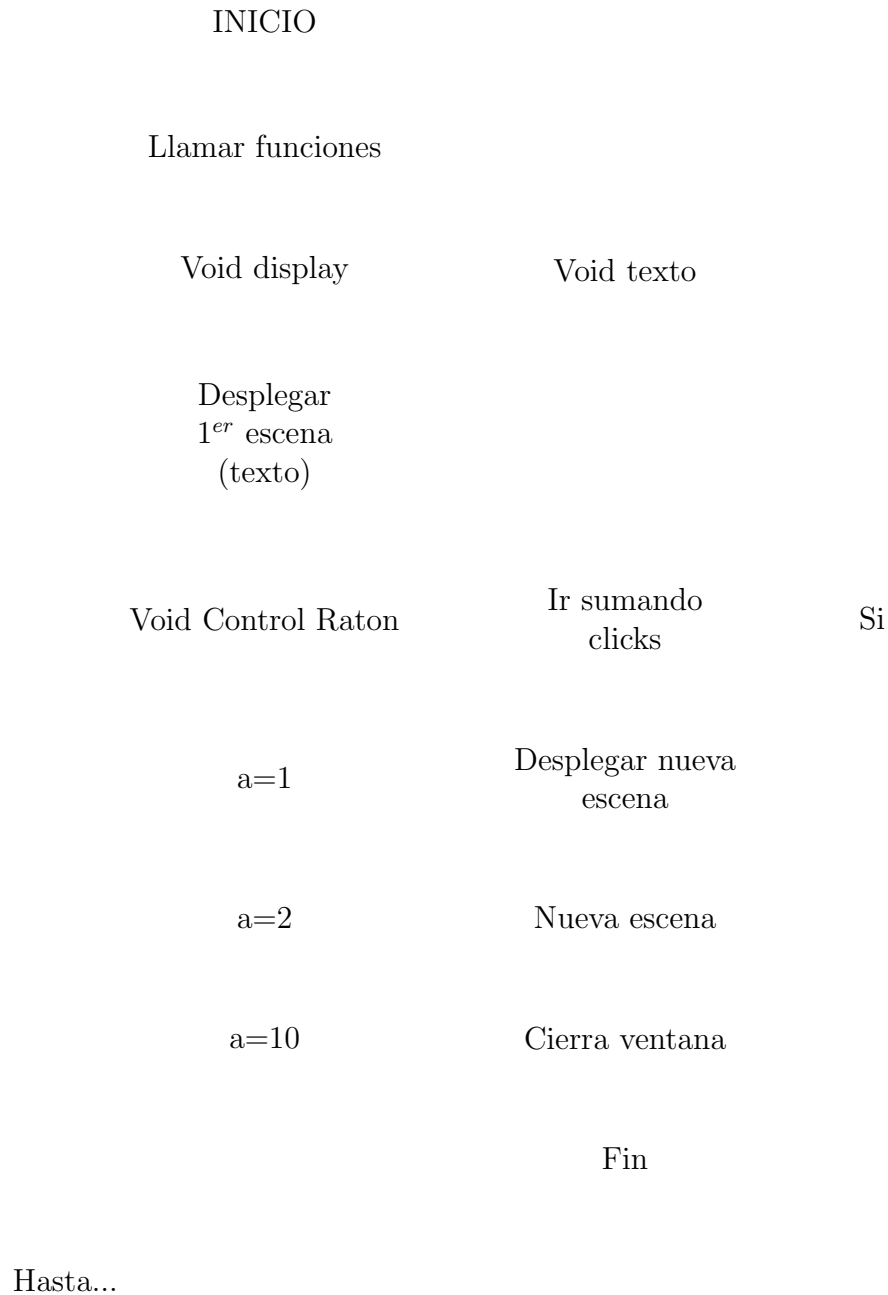

Realizar un cuento utilizando la librería `graphics.h` y todas sus funciones.

2 Introducción

Las imágenes gráficas mostradas en un monitor de computadora se componen de pequeños puntos llamados píxeles, los cuales están distribuidos en la pantalla en filas; existe una cantidad específica de filas y cada fila tiene una cantidad específica de píxeles. La cantidad de píxeles usada en la pantalla se conoce como resolución. Cada modo gráfico tiene una resolución particular.

Para habilitar el monitor en modo gráfico y utilizar sus píxeles y funciones de gráficos, es necesario incluir el encabezado `include <graphics.h>` que contiene las declaraciones y funciones relacionadas con graficación e inicializar el monitor en modo gráfico y utilizar sus píxeles con la función `initgraph()`.

3 Diagrama de flujo

3.1 Código

```
#include <GL/gl.h>
#include <GL/glu.h>
#include <GL/glut.h>
#include <iostream>

using namespace std;

int a=0;
```

```

void display(void);

void printtext(int x, int y, string String);

void ControlRaton( int button, int state, int x, int y ){
    if (button==GLUT_LEFT_BUTTON && state==GLUT_UP){
        a=a+1;
        cout<<a<<endl;
        if(a==1){
            glClear(GL_COLOR_BUFFER_BIT | GL_DEPTH_BUFFER_BIT);
            glEnable(GL_DEPTH_TEST);

            glBegin(GL_POLYGON);
            glColor3f(0.0, 1.0, 0.0);
            glVertex2f(-1.0f,1.0f);
            glColor3f(1.0, 1.0, 0.0);
            glVertex2f(1.0f,1.0f);
            glColor3f(0.0, 0.0, 1.0);
            glVertex2f(1.0f,-1.0f);
            glColor3f(0.0, 1.0, 1.0);
            glVertex2f(-1.0f,-1.0f);
            glEnd();
            glFlush();

            glColor3f(1.0, 1.0, 1.0);
            char string[64];
            sprintf(string, "Habia una vez una vaca que queria
                ser mas que una vaca ");
            printtext(60,350,string);

            glutSwapBuffers();
        }
        if(a==2){
